Seedling experiment notes

These are simulated teaching data, not a real experiment.

24 seedlings were grown in separate pots. 12 received a nutrient treatment and 12 were controls. Each plant was measured at the start and after seven days. Lengths are in millimetres.

The measurements are in data/seedlings.csv. One row describes one plant.

Example: plant P01 grew from 25.7 mm to 44.3 mm, so it grew 18.6 mm.

R code to read the table:

```
seedlings <- read.csv("data/seedlings.csv")
```
